

# **EECS 489**

# **Computer Networks**

**Fall 2021**

Mosharaf Chowdhury

*Material with thanks to Aditya Akella, Sugih Jamin, Philip Levis, Sylvia Ratnasamy, Peter Steenkiste, and many other colleagues.*

# Agenda

---

- How is communication organized?

# What we want

---

`http://123.xyz`

123.xyz server

# (Some of) What happens...

# (More of) What happens

# What we get

---

123.xyz server

# Inspiration...

---

- CEO A writes letter to CEO B

*Dear John,*

*Your days are numbered.*

*--Pat*

# Inspiration...

---

- CEO A writes letter to CEO B
  - Folds letter and hands it to administrative aide
- Aide:
  - Puts letter in envelope with CEO B's full name
  - Takes to FedEx
- FedEx Office
  - Puts letter in larger envelope
  - Puts name and street address on FedEx envelope
  - Puts package on FedEx delivery truck
- FedEx delivers to other company

# The path of the letter

---

# The path of the letter

---

- “Peers” in same layer understand each other
- No one else needs to
- Lowest level has most packaging

CEO

# Three steps

---

- **Decompose** the problem into tasks
- **Organize** these tasks
- **Assign** tasks to entities (who does what)

# Back to the Internet: Decomposition

---

## Applications

*in built on*

Reliable or unreliable transport

*in built on*

Best-effort **global** packet delivery

*in built on*

Best-effort **local** packet delivery

*in built on*

Physical transfer of bits

# Communication organization

---

## Applications

*in built on*

Reliable or unreliable transport

*in built on*

Best-effort **global** packet delivery

*in built on*

Best-effort **local** packet delivery

*in built on*

Physical transfer of bits

# OSI layers

---

- OSI stands for Open Systems Interconnection model
  - Developed by the ISO
- Session and presentation layers are often implemented as part of the application layer

# Layers

---

- Layer: a part of a system with well-defined interfaces to other parts
- One layer interacts only with layer above and layer below
- Two layers interact only through the interface between them

# Layers and protocols

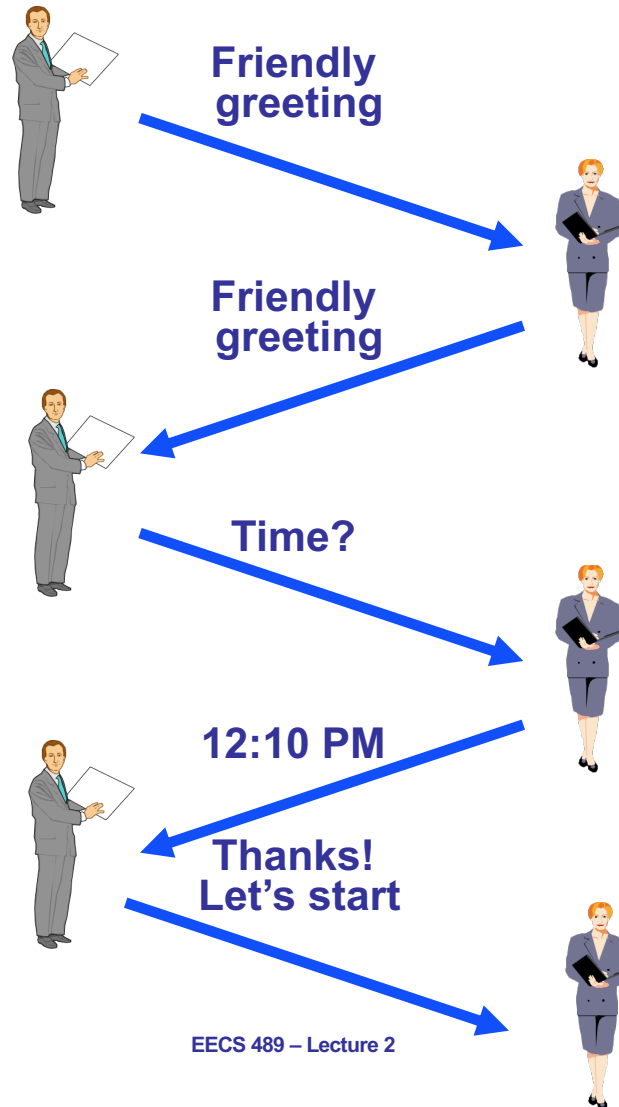

---

- Communication between peer layers on different systems is defined by **protocols**

# What is a Protocol?

# What is a Protocol?

---

- An agreement between parties (in the same later) on how to communicate
- Defines the **syntax** of communication
  - **Header** → instructions on how to process **payload**
  - Each protocol defines the format of its headers
    - »e.g., “the first 32 bits carry the destination address”

# What is a Protocol?

---

- An agreement between parties on how to communicate
- Defines the **syntax** of communication
- And **semantics**
  - “First a hello, then a request...”
  - We will study many protocols later in the semester
- Protocols exist at many levels, hardware, and software
  - Defined by standards bodies like IETF, IEEE, ITU

# Protocols at different layers

# Layer encapsulation: Protocol headers

---

**5-MINUTE BREAK!**

# Announcements

---

- Assignment 1 is out!
  - Due Sep 22, 2021
- Register your github username
  - Link in A1 spec

# Three steps

---

- Decompose the problem into tasks
- Organize these tasks
- **Assign** tasks to entities (who does what)

# What gets implemented where?

---

# What gets implemented at the end systems?

---

- Bits arrive on wire, must make it up to application
- Therefore, **all layers must exist at host!**

# What gets implemented in the network?

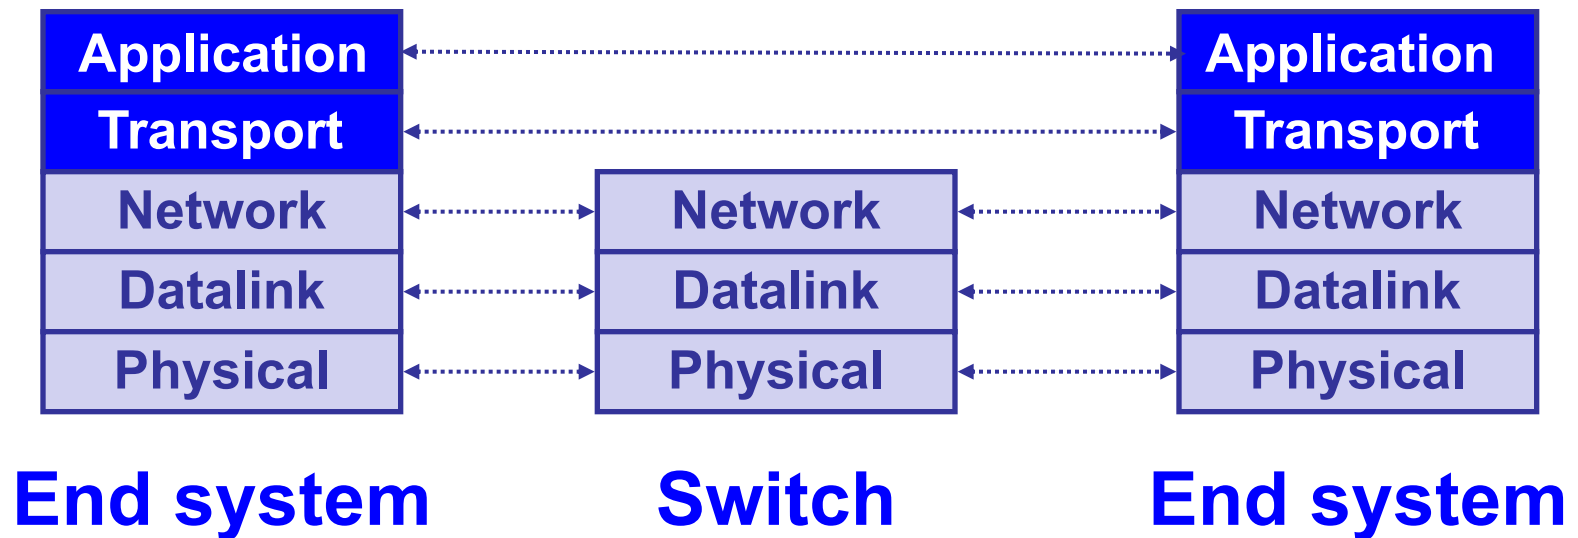

---

- Bits arrive on wire → physical layer (L1)
- Packets must be delivered across links and local networks → datalink layer (L2)
- Packets must be delivered between networks for global delivery → network layer (L3)
- The network does not support reliable delivery
  - Transport layer (and above) not supported

# Simple Diagram

---

- Lower three layers implemented everywhere
- Top two layers implemented only at hosts

# A closer look: End system

---

- Application
  - Web server, browser, mail, game
- Transport and network layer
  - typically part of the operating system
- Datalink and physical layer
  - hardware/firmware/drivers

# What gets implemented in the network?

---

- Bits arrive on wire → physical layer (L1)
- Packets must be delivered across links and local networks → datalink layer (L2)
- Packets must be delivered between networks for global delivery → network layer (L3)
  
- **Switches** implement only physical and datalink layers (L1, L2)
- **Routers** implement the network layer too (L1, L2, L3)

# A closer look at the network

---

# A closer look at the network

---

# Switches vs. Routers

---

- Switches do what routers do but **don't participate in global delivery**, just local delivery
  - Switches only need to support L1, L2
  - Routers support L1-L3
- Won't focus on the router/switch distinction
  - Almost all boxes support network layer these days

# Logical communication

---

- A layer interact with its peers corresponding layer

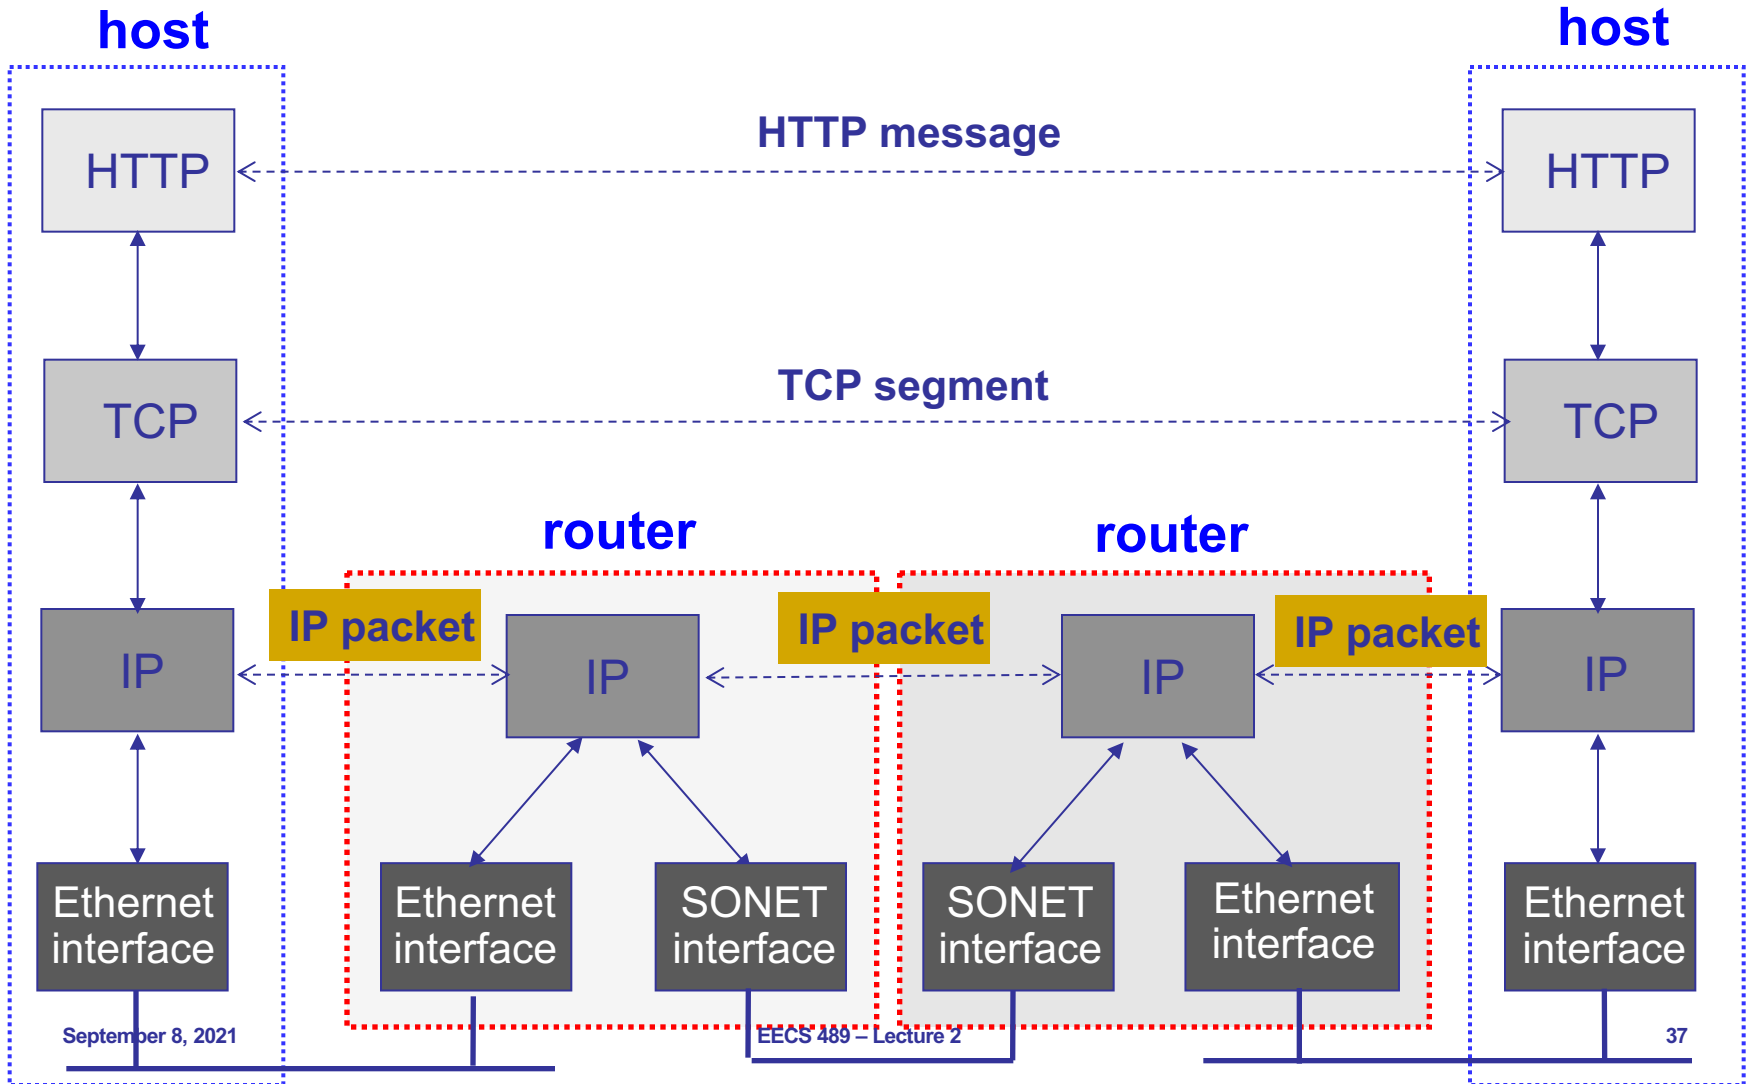

# Physical communication

- Communication goes down to physical network
- Then up to relevant layer

# A protocol-centric diagram

# Pros and cons of layering

---

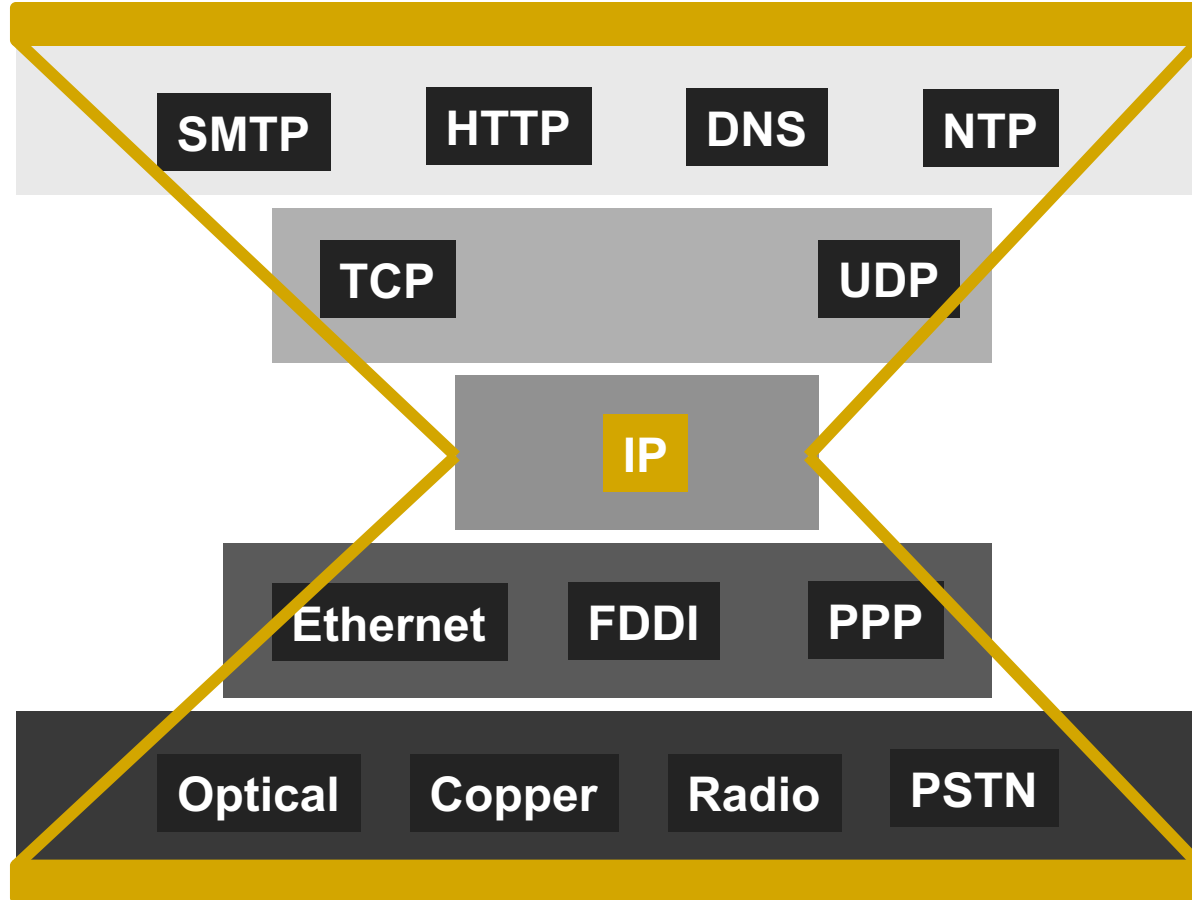

## Why layers?

- Reduce complexity
- Improve flexibility

## Why not?

- Higher overheads
- Cross-layer information often useful

# IP is the narrow waist of the layering hourglass

# Implications of hourglass

---

- Single network-layer protocol (IP)
- Allows arbitrary networks to interoperate
  - Any network that supports IP can exchange packets
- **Decouples** applications from low-level networking technologies
  - Applications function on all networks
- Supports simultaneous innovations above and below IP
- But changing IP itself is hard (e.g., IPv4 → IPv6)

# Placing network functionality

---

- End-to-end arguments by Saltzer, Reed, and Clark
  - Dumb network and smart end systems
  - Functions that can be *completely* and *correctly* implemented *only* with the knowledge of application end host, should not be pushed into the network
  - Sometimes necessary to break this for performance and policy optimizations
  - **Fate sharing**: fail together or don't fail at all

# Summary

---

- Layering is a good way to organize networks
- Unified Internet layer decouples applications from networks
- E2E argument encourages us to keep IP simple
